

AOM-0209 — Integrate Hazard Zones in DAC process

The Hazard zone is a volume of airspace within which, for example, the meteorological phenomena hazardous to traffic may occur. By nature the Hazard zone is dynamic therefore the outline of this volume of airspace should be available for processing and calculation in NM system in order to mitigate the hazardous impact of the meteorological phenomena on ATM network operations. All data describing the outline of the volume of airspace should be available as an input into Dynamic Airspace Configuration process

Rationale -

Forecast V3 end date 30-03-2021
